

The Development Document

Brief

I am working on a project where I made a website, for booking trips called *Holidae Travel*. This website is supposed to be easy to use and fun. People can look at places they want to go pick a hotel choose a flight and see how much it will cost. I also wanted to make sure the website looks nice and works well so I added some effects that make it feel smooth when you are using it and I made sure it looks good on all devices.

Technical Breakdown

This part shows my project in a video. The video is, like a tour of my website. I talk about how my website's set up. I show the things my website can do. I also explain how I made the main parts of my website using HTML, CSS and JavaScript. My website has a lot of parts. I explain how I used HTML, CSS and JavaScript to make them work together.

Video Link: <https://youtu.be/4kSRo6-2JZg>

The video is, about the hero slider and the dynamic destination system. It also talks about the booking functionality. The video covers how JavaScript is used for DOM manipulation and page navigation. The video shows how to use JavaScript for these things. The hero slider and the dynamic destination system are parts of the video. JavaScript is used to make the page work better.

Additional Requirement

The client wanted a website with features and a modern look. I made sure the website was dynamic and easy to use. One key decision was to use JavaScript to create content on the fly. I did not write everything in HTML. For instance I stored destinations in a list. Then I used a loop to show them as cards. This makes the website flexible. I can. Remove destinations easily. I do not need to change the page structure. The booking system was also important. When a user picks a destination the website opens a page. This page shows hotels and flights. I used variables to store the city and hotel chosen. Then I calculated the price based on what the user chose.

This involved using if- statements to change the price. The price changes depending on whether the user picks an connecting flight.

I added page navigation without reloading the website. I. Hid different sections using JavaScript. This creates an experience. It is better than page reloads. To make the website better I added a hero image slider. It is, at the top of the page. This uses a timer to switch images. It makes the website look professional. I used CSS animations and hover effects. They make the interface engaging. Buttons, cards and sections respond to user interaction. This improves usability. Overall I used JavaScript and CSS to meet the client's needs. I combined loops, lists, conditions and DOM

manipulation. This helped create an modern website. The client required a website. I made sure the website was interactive. The website has an user experience. The user experience is modern.

Critical Reflection

I think my travel booking project is successful because it gives people an interactive way to book their trips. One of the things about my website is that it is really easy to use. People can look through all the destinations pick what they want and see how much it will cost them without getting confused. The website looks simple and clean which makes it easy for people to understand.

Another good thing about my website is that it uses content. I used JavaScript to make things like destination cards and hotel lists of just typing everything in. This makes the website work better and makes it easier to add things to it later.

The part of the website that calculates prices is also really important. It shows that I can use code to solve problems. The website can change prices based on what people choose which makes it feel more real.

There are some things that I could make better. Now my website does not have a way to save peoples information like their login details and bookings. Later I want to add a database and make the website work with a server so it can really work like a website.

I would also like to make the website look better by adding animations and moving things around. My website looks modern. It could look even better.

I want to make my website easier to use for everyone, including people with disabilities.

My travel booking project taught me how to use HTML, CSS and JavaScript to make a complete website. I also learned how to better solve problems and organize my code.

Time I will plan more before I start coding so it will be easier and faster to make my project.
